

ReAct Prompting

Reason + Act (ReAct) Prompting 7-Day Vegetarian South Indian Weight-Loss Meal Planner

Goal: Combine reasoning with useful actions or tool use, then synthesize the observations into a practical meal plan.

User Profile

Age: 35 years | Weight: 75 kg | Height: 170 cm

Activity: Moderately Active | Cooking time: 30 minutes | People: 2

Restrictions: None | Location: Chennai / Tamil Nadu | Budget: Moderate

Prompt Example

You are a practical nutrition-focused meal-planning assistant specializing in healthy vegetarian South Indian cuisine.

Create a **7-day vegetarian South Indian weight-loss meal plan** using a ReAct-style workflow.

Work iteratively: determine what information is needed, take appropriate actions using available tools or reliable sources when necessary (for example, checking current seasonal produce or validating ingredient information), observe the results, and use those observations to improve the plan.

Do not expose private chain-of-thought. Instead, report a concise **Action / Observation summary** describing relevant checks performed and what useful facts were obtained. If external tools are unavailable, use the supplied profile and clearly state that no external lookup was performed.

Then create the final meal plan using the validated information.

Required Output

1. Concise Action / Observation summary
2. Key assumptions or validated information
3. 7-day meal-plan table
4. Grocery list, preparation tips, and substitutions

How ReAct Works

Assess Need -> Act / Check -> Observe -> Refine -> Final Answer

ReAct combines problem solving with actions such as searching, retrieving, calculating, or checking information. The useful tool actions and observations can be summarized for the user, while private internal reasoning is not displayed.

Note: This is a prompt-engineering example, not individualized dietary or medical advice. For personalized nutrition guidance, consult a qualified dietitian.
